

**DGiT nominated Finalist in ACOMMS Annual Industry Awards in Partnerships for Growth Category**

DGiT Consultants (DGiT), a specialist telecommunications service provider delivering advanced operational solutions to national and international carriers, has been nominated as one of only four finalists in this year's ACOMMS Awards Partnerships for Growth category.

Criteria for award consideration needed to demonstrate the benefit of the partnership to industry growth and development – including demand for convergent services, fostering industry knowledge and increasing competition.

“This finalist nomination is continued validation of our reputation. Optus Wholesale and DGiT have been working collaboratively for over 12 months to apply, integrate and augment DGiT's *TelFlow* software suite to deliver superior customer experience for Optus Wholesale business xDSL provisioning platform,” said DGiT's CEO, Emma Dean-Graham.

In congratulating DGiT, Gavin Williams, Optus Wholesale Director of Marketing and Strategy, said, “Optus Wholesale will utilise DGiT's *TelFlow* software suite as part of our business-grade xDSL delivery platform to improve customers' lead times, provisioning accuracy and to provide real time data back to customers. DGiT's flexible working practices will better enable us to respond and meet our customer needs in the evolving broadband market.”

*TelFlow* is a framework, developed by DGiT's research and development team, for the rapid development of automated end-to-end telecommunications provisioning solutions delivering both for the carrier and their retail customers. The solution is a suite of highly adaptable software tools designed to integrate and streamline provisioning and service management for telecommunications providers.

“Our unique solution allows telecommunications organisations to build innovation into their copper network. The normally complex xDSL copper delivery approach is managed by providing a bonded service,” said Dean-Graham.

DGiT continues to work with Optus to enable enhanced innovation within the carrier environment and create/extend a robust market for goods and services including up front service qualification and comprehensive human workflow.

*Telflow* is expected to be an important factor in the industry wide integration of carrier and telecommunications provisioning systems into the NBN (National Broadband Network) federal government initiative.
